Transformation, adaptation & a competitive advantage.

THE GREATER MANCHESTER CLIMATE STRATEGY
2011-2020

Version 21
What does Greater Manchester’s 2020 future look like?

We will make a rapid transition to a low carbon economy.

Our collective carbon emissions will have been reduced by 30% to 50%.

We will be prepared for and actively adapting to a rapidly changing climate.

‘Carbon literacy’ will have become embedded into the culture of our organisations, lifestyles and behaviours.

Conclusion ..............................................................................................................................53
Executive Summary

Somehow, it’s in our collective DNA to want to shape the modern world and be a progressive force for change. Here in Greater Manchester we’ve played a pioneering role in each and every stage of industrial innovation, from the age of steam or the splitting of the atom to the creation of modern computing.

Make something new or make something better. It’s what we do.

Achieving a strong competitive edge in the new, global market for climate change solutions is our new and primary aim, set alongside a belief in genuine sustainability, and a robust drive to measure and reduce our greenhouse gas emissions.

We also plan to prepare our urban and natural environments for the changes in climate which are already upon us, due to the large amounts of carbon emitted as the world industrialised in our wake.

These strands – building our green economy, hitting some tough but critical carbon targets and adapting to inevitable climate change – run through this, the first Greater Manchester-wide strategy on climate change.

One plan, ten districts and a million homes

This climate change strategy for Greater Manchester stretches through to 2020 and will help us fuse together the various carbon reduction plans and adaptation strategies that have been crafted by the ten districts of the city. (mention 2050 here too?)

With a co-ordinated and consolidated approach we will be more resilient and more successful – better and stronger, together.

Our strategy will guide the actions of, and be owned by, the Association of Greater Manchester Authorities (AGMA), our Local Enterprise Partnership (LEP), the Greater Manchester Combined Authority (GMCA) and our ten District Councils will drive our low carbon future alongside countless partners from all sectors.

Leadership and growth

We are building on solid foundations. The low carbon and environmental goods sector of the Greater Manchester market is already worth £4.4 billion, supports 34,000 jobs and is projected to grow at more than 4% over the next five years. We are also committed to carbon leadership – Manchester is one of 2,600 cities in Europe that has signed up to the Covenant of Mayors, committing themselves to exceed the EU’s 20% target for CO2 reductions.
This 2020 strategy encompasses a broad range of areas from innovation, renewables and energy efficiency to new business opportunities, the protection and enhancement of our green space and the actions of individuals and organisations across all of our communities and neighbourhoods.

**Understanding our carbon footprint**

Our progress will be measured first, through a new carbon footprint for Greater Manchester based around the direct emissions covered in the national carbon inventory but we are committed to broadening our knowledge dramatically in this area, to get a true sense of our ‘total carbon footprint’ that will include outsourced or secondary emissions, such as the food we consume or the products we import.

This wider scope of emissions will be of increasing importance in the future and will certainly be the gauge by which the UK judges it’s 80% carbon reduction goal for 2050. It will also be a measure we use to benchmark ourselves against the leading low carbon cities in the world.

We want to start to measure, today, the things that will be critical, tomorrow.

**Unifying priorities, securing investment and identifying solutions**

In addition to things like renewable-powered trams, green energy schemes, electric vehicle plans and public engagement campaigns, there is a strong economic underpinning to Greater Manchester’s strategy. Our status as a Low Carbon Economic Area for the Built Environment (LCEA) has led to the development of a portfolio of workstreams that will support 68,000 jobs, generate £1.4 billion in economic activity and reduce CO₂ emissions by 6.1 million tonnes.

The other plans connected to this strategy include an emerging Greater Manchester Energy Plan, our recently agreed Local Transport Plan (LTP3) a climate change action plan for the Greater Manchester Waste Disposal Authority, a GM Spatial Framework which will put in place during 2011 and an AGMA Green Infrastructure Framework and Action Plan.

**Our strategic objectives**

This strategy is based around four goals, a series of priority actions and a set of indicators we will use to measure our progress. These four key goals for 2020, are:

- **We will make a rapid transition to a low carbon economy.**

- **Our collective carbon emissions will have been reduced by 30% to 50%.**
- We will be prepared for and actively adapting to a rapidly changing climate.

- ‘Carbon literacy’ will have become embedded into the culture of our organisations, lifestyles and behaviours.

Our low carbon transition goal will see up to £10 billion investment in projects across Greater Manchester over the next five years. Our approach will be to integrate that investment with interventions that support skills across the work force as well as growth in the supply chain, increased local manufacturing and assembly, and greater business resource efficiency.

The carbon emissions goal will see us tackling direct carbon emissions, from energy use in our buildings, transport and infrastructure to an increase in the generation and deployment of renewable energy. We will also start to measure our ‘indirect’ emissions, which will need to be taken fully into account as we move towards the UK’s 2050 target of an 80% reduction in emissions.

With possible 4°C temperature rises above pre-industrial levels by the 2070s, our goal to adapt to future changes in climate will be critical, through adaptation strategies that anticipate risks and enhance resilience. From protecting future energy sources to watercourse infrastructures, local biodiversity to civil contingency planning, early action will pay dividends.

Finally our cultural goal around carbon literacy is centred upon the fact that 20% of the energy we consume is down to the way we use our buildings and modes of transport, rather any technological ‘fix’. Our plan is to ensure Greater Manchester builds training and communications programmes that help us rethink how we work, play and live in a low carbon world.

On track and on target

We will track our progress through a small number of key indicators:

- a correlated measure of carbon emissions and economic activity
- a measure of the growth in low carbon jobs and the scale of the low carbon and environmental technology and services sector
- annual direct CO₂ emissions/emissions per capita
- energy generated by renewables
- the extent, quality and productivity of green spaces and tree cover
- the number and quality of resilience plans and adaptation strategies

These indicators will be our city-wide barometer of success and will be widely shared with our partners and citizens alike.

Reaching our destination
We know what we want to achieve together and we’ve got measures agreed that will show us whether we’re making the grade, but this strategy also lays out a number of actions that we need to take forward across Greater Manchester.

These are not the end of our action on carbon. Each home, each business and each local authority will have a host of other critical things they need to do or change if we are to (take this opportunity to establish a low carbon prosperity as our legacy to future generations....) stand a chance of hitting our targets and play our part in tackling climate change. This strategy includes, however, some of the important tasks we need to take on together as a city.

Our homes generate 36% of our direct carbon emissions and the commercial sector generates a further 36%, much of it associated with building use. **Retrofitting our buildings** with energy efficiency or renewable energy measures will be our biggest area of activity by a significant margin.

We will work with householders, developers and social landlords to create a Greater Manchester ‘Green Deal’ programme that delivers **jobs, and business opportunities**, out of this immense programme of refurbishment and construction.

How we use and generate energy will of course be vital and while the ‘decarbonisation’ of the electricity grid will be a national goal, our action in Greater Manchester on **local generation, reducing energy use, smart grids** and **district heat networks** will still contribute a 5% reduction in carbon emissions by 2020, again while offering opportunities to our low carbon industrial sector. We will also ensure that we make full use of the market opportunities offered by the **£100 million of energy research** being undertaken by Greater Manchester’s universities.

Almost a third of our direct carbon emissions come from transport and here we will work across Greater Manchester to continue to expand the **Metrolink** network, make radical improvements in other forms of **public transport** and achieve the shift towards **electric vehicles** not least through a city-wide charging network. We will also bring in integrated smart-ticketing and invest significantly in the lowest cost but highest impact activity – encouraging people to switch to **cycling or walking**.

Our **green spaces, waterways and natural areas** will be of increasing importance as a cooling mechanism as climate change occurs. We will put in place programmes to protect but also to increase their coverage, for example by increasing tree cover. This will have the triple benefit of helping us adapt to climate change, improve health and wellbeing but also ensure that more carbon stays locked into our landscape through these natural carbon ‘sinks’.

This strategy also includes a series of actions focused on the carbon reductions we can make as **consumers**. This wider footprint, made up of the things we buy and the food we eat, will be of ever-increasing importance over the decades to come. We will work to create a **total carbon footprint** for
Greater Manchester and bolster our programmes for both businesses and individuals that promote and encourage more sustainable choices, whether that’s reducing waste, using less energy or purchasing lower carbon alternatives when it comes to food or consumer goods. This area of activity will be important in helping us to achieve the shift to a low carbon culture but will open up new market opportunities too, if we ensure that our businesses and creative industries are engaged in creating future, innovative, low carbon alternatives to the high carbon products of today.

Getting our act together

Carbon and climate change show a wilful disregard for political boundaries or areas of administration, which means a crucial element of success will be working together in a more co-ordinated and consolidate way.

Under this strategy we will start to co-ordinate and align the carbon reduction and adaptation plans across our ten districts so that we have a ‘single plan’ for the city. We will also establish a common methodology for measuring carbon and a shared platform for carbon reporting across Greater Manchester that delivers transparent and understandable information to businesses, residents and visitors.

Business has a vital role to play in climate change but it can also benefit from early action, too. We plan to bring together a number of business support and engagement networks across Greater Manchester to develop a co-ordinated support service that will help business save money through reduced energy use, take full advantage of the low carbon supply chain, adapt their operation in the face of future climate change and be part of the next wave of industrial innovation bringing low carbon, green technologies to market.

We will also ensure that our strategy puts energy security, climate adaptation and a low carbon infrastructure at the heart of Greater Manchester’s Spatial Framework and that it informs Local Plans, too. Whether it’s water supply, flood risk or biodiversity we want to ensure that all our spatial plans are ‘carbon-proofed’ in the future.

This process of alignment will be enhanced further by the creation of a Greater Manchester-wide combined team, working under AGMA’s Environment Commission, to ensure the joined-up delivery of this strategy for 2020, working with business, our ten districts, other AGMA commissions and key organisations such as the Greater Manchester Waste Disposal Authority and Transport for Greater Manchester.

The people at the heart of our plan

Climate change is being caused by humans and it is people like us that will feel its impact. It’s people like us that will be at the very heart of delivering a safe and secure, low carbon future to our children. That’s why the final thread of action in our Greater Manchester strategy on climate change is focused on people and communities.
Our plan is to ensure that **health and wellbeing** is considered across all our actions and that we work, for example, to reduce fuel poverty through the very same activities that we launch to reduce energy use. We also will work to ensure that the most deprived or vulnerable across Greater Manchester are not those that are most exposed to the risks associated with climate change impacts.

The opportunities that our large-scale investment programmes bring will be maximised to the full. We will deliver programmes to broaden our base of **low carbon skills**, develop **green apprenticeships** and **training partnerships** with partners in further and higher education.

And most importantly we will engage all of those who live or work across Greater Manchester in our mission to cut carbon and adapt to change. We will work hard to **win hearts and minds**. To encourage the thousand daily acts, however big or small, that will help us reach our goal of a low carbon future: the car keys left on the counter; the meat-free lunch; the thermostat turned down; or the light switched off.
PART 1: STRATEGY, PURPOSE & OBJECTIVES

1. The only future that counts

Greater Manchester has been called the ‘city of change’ and today, it is preparing itself for a markedly different tomorrow. Our reputation, worldwide, was shaped from coal and steam and the utilisation of natural resources, now the world’s first industrial city is marking out a more sustainable path for its future. The price of carbon is set to challenge the price of oil as our primary economic barometer. Our resilience in the face of climate change will be critical for our health and prosperity.

We know that the nations and cities that move swiftly to change their culture and develop the technologies required to reduce carbon emissions will be more competitive, less vulnerable and better prepared. They also have a responsibility to deliver a more sustainable, low carbon future.

That future is one in which cities and neighbourhoods work in greater harmony with natural systems, where homes and businesses create as well as consume energy, where electric vehicles and public transport are the transport of choice, buildings and services are highly efficient, where streets and public spaces follow a greener design plan, so our urban nature can be cool and cope better with hotter, more changeable weather.

This is Greater Manchester’s next major challenge. Across a little less than a generation, the city has already been transformed and regenerated through an impressive array of public and private sector endeavours, its natural heritage almost fully recovered from the blight of its industrial past. Our economy has diversified away from its original reliance on heavy industries and is flourishing in other sectors such as media, finance, sports and the creative arts. Greater Manchester is the most vibrant and productive contributor to UK productivity outside London and the South East. Now we have to become a global leader in the most important emerging market of all, the low carbon economy – to become a global hub for development, technology and cultural change, proficient in the design, production, and use of the tools required for reducing global emissions.

A clear vision and determined leadership will be the cornerstones of achieving this change. The Association of Greater Manchester Authorities (AGMA), our Local Enterprise Partnership (LEP), the Greater Manchester Combined Authority (GMCA) and our ten district Councils will drive our low carbon future alongside countless partners from all sectors. Their resolve will be based on the firm belief that we can deliver, in the face of the threat of climate change, greater prosperity, resilience and an improved quality of life for all our residents and businesses. This is the future we must secure; the only future that counts.
2. Delivering ‘prosperity for all’

‘By 2020, the Manchester city region will have pioneered a new model for sustainable economic growth based around a more connected, talented and greener city region where the prosperity secured is enjoyed by the many and not the few.’

This is the vision of the Greater Manchester Strategy (GMS), the plan that sets our direction of travel to 2020 and priority actions to 2020. The vision is of prosperity for all, rooted in our culture of enterprise and the regeneration we have achieved in recent years. Among its key priorities, it emphasises the interdependence between economic growth, future prosperity and the quality of the local and global environment.

Two of the core principles in the GMS state that ‘We will be known for our good quality of life, our low carbon economy and our commitment to sustainable development.’ and ‘We will create a city region where every neighbourhood and every borough can contribute to our shared sustainable future.’ The Strategy also states that ‘A timely shift to a low carbon economy and the challenge of adapting to a rapidly changing climate both offer opportunities to the city region. Conversely, failure to cut emissions and adapt to climate change will fundamentally undermine our economic viability and success.’

The creation of our low carbon economy depends upon understanding and maintaining a sustainable environment. Achievement will involve greening existing businesses and creating new ones, replacing the activities that have generated the wealth in the past with new economic activity. It will entail further growth in the technological, knowledge and cultural economies, and the development of new skills and strong supply networks. The low carbon and environmental goods sector for Greater Manchester, measured in 2008/9, was already worth £4.4 billion, supporting 34,000 jobs and projected to grow at more than 4% per year.

The vision we set out in the Greater Manchester Strategy is based on a detailed economic assessment, the Manchester Independent Economic Review (MIER). A subsequent ‘Mini Stern’ report for Greater Manchester clearly revealed the economic benefits of tackling climate change.

Our future plans, such as a new Spatial Strategy, an Energy Plan and our Local Transport Plan will all reflect this opportunity, detail how the future may be realised and ensure that our shared approach to the global challenge of climate change, outlined on these pages, makes sense at this spatial scale, as well as in each District, more locally in each of our neighbourhoods, in every business and in the lives of families and individuals.

The global market value of the low carbon environmental goods and services sector was measured at £3,046 billion in 2007/8. Asia accounts for 38% of this total, Europe 27%, and the Americas 30%. Globally, traditional Environmental activities account for £657 billion (21.6% of the global total),
Renewable Energy for £940 billion (30.9%) and the Emerging Low Carbon activities for £1449 billion, or 47.5%.

3. City leadership on climate change

In the last decade, an important milestone was passed: more than half of the world could now be found living in cities. By the middle of this century, that figure is set to reach 75%. It is in cities that our collective future lies and in cities where the challenge of climate change will be met. Manchester is one of 2,600 cities in Europe that has signed up to the Covenant of Mayors, committing themselves to exceed the EU's 20% target for CO2 reductions; more than a 1000 US cities have made a similar pledge.

All these cities recognise that the climate science is now irrefutable: the Earth’s climate is changing because of increases in greenhouse gases in the atmosphere, mostly caused by human activity. Through energy use, waste and deforestation we have changed the delicate carbon balance of the planet.

Our collective future is dependant on a global effort to reduce CO2 emissions, and on local efforts to adapt to a changing climate: the opportunity to maintain a high quality of life can only be taken by developing a low carbon economy and by learning to live differently – within the capacity of our environment’s ability to support us and all of nature. For us in Greater Manchester, this brings us full circle: the world’s first industrial city, original and modern, was a leader in the industrial revolution that began the cycle of human technology increasing greenhouse gases. Now we need to be leaders in the carbon revolution.

From the breakthrough 1992 Earth Summit in Rio, through 1997’s Kyoto Protocol, to the EU’s own Emissions Trading Scheme, international efforts on climate change have met with limited success. In spite of this, the UK has been adopting a leading role, not least through the introduction of our Climate Change Act in 2008, an international first; this sets a target to reduce CO2 emissions by a minimum of 80% by 2050, sets legally binding carbon budgets and establishes a National Climate Change Risk Assessment process. The Low Carbon Transition Plan, published in 2009 set out how the UK will deliver these emission cuts required through annual carbon ‘budgets’. The most recent of these, agreed in 2011, sets a 50% reduction by 2027.

In Greater Manchester, we have recognised that this is a time of change and opportunity: a period of transition which we can shape in line with our vision of improving our city as an effective and powerful economic area, with prosperity for all and sustainability for future generations. We have established our own Environment Commission with a role in both AGMA and the Combined Authority to guide this agenda.

We have also made a start on delivering programmes of activity – establishing a renewables-powered light rail system in Metrolink, creating low carbon buildings at the heart of our regeneration, putting in place a sustainable solution to an annual 1.1 m tonnes of municipal waste, valuing our green spaces – but we know we need to grow our understanding of environmental capacities, possibilities and technologies, further exploit our strengths in innovation and enterprise and translate the challenges of climate change.
change into the development of a low carbon economy that benefits every neighbourhood, business and household.
4. Our shared carbon footprint

Key to our success is to develop and maintain an adequate and up to date understanding of where and how we are generating carbon emissions so that we can chart our progress and prioritise our actions. Our approach will be to use and follow the development of the national carbon inventory which currently focuses primarily on direct emissions from fuel use and power generation.

This enables us to be consistent with national and international carbon budgeting, and more easily compare progress with other cities across the globe. However, we are aware that this does not currently include all carbon emissions, especially those relating to aviation and shipping, and the embodied emissions in the materials we use in our buildings, infrastructure, supply chains and services; neither does it account for changes to our landscape.

Estimates show that exported goods accounts for 25% of global and this is growing rapidly, by 2025 it is predicted that net emissions imports to UK will account for 50% of the UK’s consumption emissions. Actions within this strategy recognise the importance of acting upon this wider scope of emissions, and as robust information and methodologies are agreed, these will be progressively included in our carbon reporting.

According to the most up to date measurements from the Department for Energy & Climate Change (DECC) total direct emissions in Greater Manchester during 2005 (the first year this data was available) amounted to 18.2 million tonnes of CO2. Indicative figures for 2008 suggest that our emissions have fallen to approximately 17.5m tonnes, giving an average, of 7.1 tonnes per person. This is lower than the average national figure of 8.7 tonnes per person. There has been a recent downturn in emissions across Europe by an average of 6%, a short-term impact related to economic conditions, much of which may have been offset by the exporting of production: there are also signs that emissions have begun to rise back to the business as usual level.

---

1 The background to this strategy utilises data on emissions expressed as CO2. Where, in the strategy we have used the term carbon, this is used as shorthand for CO2. Write in comment about CO2e. Add in figures per capita for each district (in diagram).
2 Our Strategy focuses on absolute emissions targets rather than per capita targets because the latter are subject to fluctuations in population.
Figure 1 below shows how this figure is distributed between Districts across GM.

The consumption of electricity accounts for 36% of our direct carbon emissions, a further 33% comes through the consumption of gas and 25% through use of petrol and diesel road transport fuel. This means that 95% of our direct\(^3\) carbon emissions arise from buildings, energy and transport, giving us immediate priority areas for action.

\(^3\) Note that this means Scope 1 and Scope 2 emissions
The move to include a wider scope of ‘embodied’ emissions has been started through work already undertaken by the North West Sustainable Consumption and Production Plan and in business programmes such as ENWORKS: it will be of increasing importance as the impacts of ‘outsourcing’ emissions through imported goods and services are better understood.

Indicative estimates show that when we incorporate these embodied emissions, including those related to imported products and materials the total carbon footprint of Greater Manchester may be nearer 15 tonnes per capita rather than the 7.1 through direct emissions. The practical impact of this on our strategy is that our approach to sustainable consumption will be of critical importance and that we need to develop the ability to understand, measure and manage the aggregate value of Greater Manchester’s ‘carbon balance sheet’ including outsourced materials and services and the existing carbon ‘sinks’ of our peatlands and woodlands.  

---

4 Insert in development consumption based analysis here
5. Greater Manchester – the state of play

We have already made a start, with significant local achievements to build on. New low carbon buildings, renewable-powered trams and urban woodlands are well-established parts of our approach to regeneration; micro-generation plants using solar and wind, hydro and waste have begun to appear in our neighbourhoods; alternative fuelled buses are in use, car clubs are established and a programme has been launched to bring an electric vehicle infrastructure to the streets of our city; promotional environmental campaigns like Manchester is My Planet are part of the culture in schools, businesses and neighbourhoods, and we have an unrivalled base of climate change knowledge and research in the Universities of Manchester and Salford.

We have begun to establish new tools for creating and attracting investment, shaping partnerships and budgets to maximise returns and public interest. More than 3,000 of Greater Manchester businesses are already signed up to environmental good practice, our Universities are established world leaders in climate change research and our city is home to thriving third and social housing sectors already engaged with the practice of low carbon lifestyles; events such as Manchester International Festival and FutureEverything highlight and promote the technologies and lifestyles of our greener future.

Our strategy builds upon progress already made in Greater Manchester and on the UK Low Carbon Transition Plan and the Northwest Climate Change Action Plan. It pulls together and strengthens a range of existing plans and policies that contribute to the Greater Manchester Strategy. It will provide a framework of objectives and priority actions that constitute our collective action on climate change: the details of delivery will be set out in a suite of thematic plans and local policies.

Low Carbon Economic Area

Greater Manchester was designated as a national Low Carbon Economic Area (LCEA) in 2009 with a focus on the built environment. AGMA’s LCEA Delivery Plan 2009-2014 was drafted to provide a portfolio of workstreams that begin to establish a built environment and infrastructure across the city that is highly energy efficient, and to develop the markets and capacities for low carbon goods and services. These workstreams are based on the Manchester ‘Mini Stern’ report of 2008, which indicated a potential £20 billion of loss revenues over the years to 2020 if we fail to prepare for climate change. They represent a fast growing investment portfolio that includes physically retrofitting buildings and decarbonising energy supply, establishing suitably equipped and skilled businesses and workforce, stimulating innovation and helping to inform delivery of a strengthened spatial planning framework. These priorities will help support 68,000 jobs, £1.4 billion whilst reducing 6.1 million tonnes of CO₂ emissions.

Greater Manchester Energy Plan

Work is under way by the AGMA Energy Group, formed in 2010, to develop a Greater Manchester Energy Plan. This will build upon a recent
Decentralised and Zero Carbon Energy report and a Sustainable Energy Action Plan (SEAP) which detailed proposals for developing our energy infrastructure and increasing local generation from renewables. The new plan will set out our commitments to increasing ‘smart’ grids, smart metering, networks for electric vehicles and map the rapidly changing operating environment for energy producers and consumers.

Local Transport Plan

Headline proposals for reducing emissions from transport are incorporated in our third Local Transport Plan (LTP3) agreed in April 2011. This sets out plans and spending priorities over the period to 2025 together with a series of detailed Local Area Implementation Plans which set out collective spending plans for the next four years, up to 2015. Carbon emissions from all transport in Greater Manchester account for over 30% of total direct emissions, and future growth projections suggest that radical change will be required if we are to achieve our current low carbon targets. LTP3 provides a set of investment priorities and activities for transport that support the maximum potential economic growth while creating a framework for lower carbon travel patterns and a platform for low carbon proposals being put to the Local Sustainable Transport Fund.

GMWDA Climate Change Action Plan

The Greater Manchester Waste Disposal Authority set out its strategic proposals on climate change in 2009. The plan includes a revised approach to waste, targeting zero growth and increasing recycling rates from around 30% to at least 50% by the year 2020, and aiming to substantially reduce the level of carbon emissions from approximately 80,000 tonnes of CO₂ per annum in 2008/09 to 370,000 tonnes in 2015 and 400,000 tonnes in 2020. These saved emissions represent 5% of Greater Manchester’s total target saving to 2020.

Greater Manchester Spatial Framework

The action plans above, and the aims and objectives of this strategy, will be set in a spatial context through a GM Spatial Framework. To be put in place during 2011, it will help us plan together for growth. This will recognise the critical connections and interdependencies between different geographical areas and guide and focus investment, growth and infrastructure development to areas where it can have a positive impact beyond the purely local or neighbourhood level. It will provide the framework for cooperation and delivery of the Greater Manchester Strategy, and concentrate on the issues that are important for the conurbation as a whole.

Green Infrastructure Framework

Optimising the assets of the physical environment will be the key objective of a forthcoming AGMA Green Infrastructure Framework and Action Plan. This will provide a policy and evidence base for valuing, maintaining and developing our landscape and green space assets through better targeting of green infrastructure interventions and investments, and integrating the
concept of ‘ecosystem services’ as a key component of a low-carbon society. It will assess the capacity and biodiversity of our environment, summarise the multi-functional value of our land assets and set out how we can protect and enhance the contribution that Greater Manchester’s natural systems make to climate change resilience, to health and wellbeing and economic prosperity; how we invest to optimise the local natural environment and protect it for future generations.

**Flood Risk Management**

‘Climate change is forecast to increase the number of extreme weather events, particularly flooding and several plans designed to address these risks are in development. Management of our ‘blue infrastructure’ is key: Flood Risk and Surface Water Management Plans involve the Districts, the Environment Agency and other partners working together to identify areas at risk from surface water flooding and developing Flood Risk Assessments and a GM Flood Risk Management Strategy.

**EcoCities**

Greater Manchester’s adaptation and resilience challenges and opportunities are being brought together in the action-research programme led by the University of Manchester, supported by property company Bruntwood. The outcome of the current phase of the EcoCities programme, due for completion in December 2011, will be a state of the art adaptation ‘blueprint’ for Greater Manchester.

**Local Authority and District Plans**

Across all ten Districts of Greater Manchester there are already climate change plans approved or in development. The challenge for this Greater Manchester Climate Change Strategy is to work with each of these, particularly as they have a diverse set of timescales, baselines and objectives. In time, one objective of this strategy is to align and combine all these plans into a single, Greater Manchester-wide plan.

All Districts also have ‘Core Strategies’ adopted or in development that set out the policy planning frameworks for the period to 2020. These Core Strategies take account of climate change issues and targets and set out how local planning policy and practice can steer the capacity for energy efficiency and climate change resilience in new developments.
6. Our strategic objectives on climate change

The next decade will set the course for a global future in which Greater Manchester can and will play a key part. This strategy is the framework we will use to work together, across our ten Districts and with organisations across our city, to co-ordinate our collective action and work with national government, to help deliver the UK’s ambitious goal of an emissions reduction target of 80% by 2050, and to ensure that our neighbourhoods and businesses are resilient to the impacts of a changed climate.

Our approach will be based on collaborative working. Harnessing the skills, knowledge and creative energy of all Greater Manchester’s people and organisations will be key to success. The challenge of this agenda does not acknowledge boundaries between places and sectors and our response will reflect this. Taken together, we have capacity and determination and it will be part of our strategy to develop the arrangements necessary to enable the public, private, third and academic sectors to increase the impact of that capacity by working as one team.

This strategy is based around four objectives, a series of priority actions and a set of indicators we will use to measure our progress. Together these will provide a framework for reducing the cumulative impacts of climate change, addressing resource security, and realising the benefits of moving to a low carbon economy, but it is a framework. Across Greater Manchester, action at all levels will be critical in delivering success – local action in the daily lives and businesses of our 2.6 million people, collective strategic action by Districts and organisations and co-ordinated action working with Government.

Key to this process will be the small number of strategic objectives and indicators that guide all our actions, and that can be monitored and reported to create a clear picture of our goals and our progress towards them. These goals are :-

- We will make a rapid transition to a low carbon economy.
- Our collective carbon emissions will have been reduced by 30% to 50%.
- We will be prepared for and actively adapting to a rapidly changing climate.
- ‘Carbon literacy’ will have become embedded into the culture of our organisations, lifestyles and behaviours.

These four goals represent the strategic objectives that are common to all our plans; they all depend upon progress across most, if not all of our thematic action areas and we will only attain them by working on different programmes at different scales simultaneously and interdependently.
Adopting these four goals as our strategic objectives will enable us to apply the principles of sustainable development\(^5\) to the achievement of our vision of prosperity for all – as well as providing a basis for indicators that can be used to monitor and measure progress.

\(^5\) Sustainable development underlines the importance of interactions between the economy, society and the environment.
6.1 Core objective: We will make a rapid transition to a low carbon economy

‘We have to achieve an increase in productivity and prosperity that does not bring with it an associated increase in our carbon emissions. We need to ‘decouple’ economic growth from ever higher levels of carbon and then we need to work hard, through energy efficiency, behavioural change and investment in environmental technologies, to drive those emissions down still further.

‘If we do this right, the steps we take to cut emissions will increase the city region’s productivity and lead to new business opportunities that enhance our prosperity. If we get it wrong, or simply react to legislation, our efforts to grow prosperity and improve quality of life will be undermined by changing markets and a changing climate.’

These are our low carbon aspirations in the Greater Manchester Strategy. Achieving this transformation will involve securing investment to support the retrofit of our building stock and the creation of a low carbon infrastructure: We will have to ensure our supply chain is prepared to meet and capture demand. New skills will be needed and we will have to change the shape and nature of our workforce. Our embedded and significant knowledge base will help drive enterprise and commercial opportunity.

Over the next five years the potential investment in low carbon projects in Greater Manchester will be in the region of £8-10 billion. Our approach will be to integrate that investment with interventions that support more skills across the workforce as well as growth in the supply chain, an increase in local manufacturing and assembly and stimulation of wider business resource efficiency.

This is a time-limited opportunity: the global economy is changing, resource availability and the onset of Peak Oil are multiplied by the rapid rise of developing economies. Acting early will ensure that Greater Manchester is well positioned to win a share in emerging markets and build competitiveness through adopting more resource efficient practices. Our Low Carbon and Environmental Goods sector, already worth £4.4 billion and employing over 34,000 people across 1,900 companies, is projected to see annual growth rates over the next five years of more than 4%. We need to underpin and accelerate that growth.

The scale of the task of transforming buildings and infrastructure is enormous: it will stimulate demand for retrofitting and other low carbon technologies and services, it will support and grow low carbon businesses and sustainable social enterprises. Where public spending is reducing rapidly and there is growing emphasis on more inclusive self-sufficient neighbourhoods, this transition offers a substantial opportunity for future prosperity.

And our strategy will stimulate action beyond the discrete confines of the low carbon sector itself. We will work to increase levels of ‘eco-innovation’ in our other important sectors (e.g. manufacturing, finance, digital), and ensure that
all businesses are working to ‘decarbonise’ and reap the benefits of energy savings and more sustainable practices.

We will track our progress on this objective through two indicators:

- a correlated measure of carbon emissions and economic activity
- a measure of the growth in low carbon jobs and the scale of the low carbon and environmental technology and services sector
6.2 Core objective: We will have reduced carbon emissions by 30% to 50%

Greater Manchester intends to make its contribution to the targets set in the UK Climate Change Act and the UK Low Carbon Transition Plan and if possible, exceed them. This is the right thing to do as part of the global effort to combat climate change, but it will also increase our prosperity – through creating opportunity and diminishing risk - as we move to take full advantage of the emerging and dynamic low carbon economy.

To tackle the direct carbon emissions that arise from energy use in our buildings, transport and infrastructure we will have to use less energy, more efficiently. We will also work to facilitate the generation and deployment of renewable energy to support the decarbonisation of the national energy supply, create and support ‘smart’ decentralised energy systems for communities and businesses and utilise alternative fuels for power, heat and transport.

Developing and delivering the projects and programmes that create these reductions will be informed by the development of carbon budgets. The UK Low Carbon Transition Plan quantifies target emissions savings by sector. Recognising that emission levels vary both by sector and from District to District, we will work together to apply this framework to build up a picture of quantified targets and budgets specific to sectors and localities across Greater Manchester.

While we are primarily focused on reducing these ‘direct’ emissions of CO2, these form part of a more complex picture, including emissions of other, less prevalent, greenhouse gases like methane and the full ‘carbon cycle’, that includes the carbon ‘embodied’ in our buildings, our landscapes and the materials, goods and services we produce and consume.

Our strategy recognises that these ‘indirect’ emissions will need to be taken fully into account in moving to the UK’s 2050 target of an 80% reduction in emissions and it begins to pioneer a methodology that enables Greater Manchester to take a lead in understanding a consumption-based approach to the impacts of local and ‘outsourced’ emissions and the culture change necessary to achieve our long-term goals.

* A 30-50% target was agreed as part of the GM Strategy. A more specific target will be inserted here in the final draft, once it has been developed by the GM metrics project, see section 8.2 below.

We will track our progress on this objective through two indicators:
- annual direct CO$_2$ emissions/emissions per capita
- energy generated by renewables
6.3 Core objective: We will be prepared for and actively adapting to a rapidly changing climate

Radical action on carbon emissions is needed in order to pass a viable and safe climate onto future generations, our challenge today however, is also to prepare for the rapid climate change that is already underway due to the greenhouse gases already released into the earth’s atmosphere. This preparation is made doubly urgent given that global carbon emissions are continuing to rise, not fall.

Research from the UK’s Met Office predicts that global average temperatures could rise 4°C above pre-industrial levels by the 2070s, if not earlier. This poses risks and opportunities for Greater Manchester, where projections collated by EcoCities ™ highlight annual average temperature increases of around 2.5°C, by 2050, accompanied by wetter winters, drier summers, more intense rainfall events and winter storms.

Present day extremes of weather and climate, particularly floods and storms, already impact on residents, neighbourhoods and businesses in Greater Manchester. These risks are projected to increase and diversify over the next 40 years, creating greater and more frequent threats to infrastructure, services and those in hard to reach groups and vulnerable neighbourhoods. The University of Manchester’s EcoCities project highlights increases in high temperature and heavy precipitation events that would increase the incidence of floods, droughts and heatwaves for Greater Manchester.

Managing these risks is critical to developing and maintaining future economic resilience, raising the prospect of substantial future costs to the local economy. Much of this can be avoided by the development of planned adaptation strategies that anticipate risks and enhance resilience. Steps are already being taken to implement programmes that maximise the opportunity cost of early action – protecting the future of our energy and watercourse infrastructures, ensuring habitat connectivity to maximise species adaptation in local biodiversity and through civil contingency planning.

In addition to anticipating and adapting to weather and climate risks specific to Greater Manchester, the city region needs to respond to risks that arise indirectly from much more severe climate change in other parts of the world. These include challenges associated with population movements, economic instability and threats to food, energy and resource security, as well as increased pressure on global resources.

We will track our progress on this objective through two indicators:
- the extent, quality and productivity of green spaces and tree cover
- the number and quality of resilience plans and adaptation strategies
6.4 Core objective: ‘Carbon literacy’ will have become embedded in the culture of our organisations, lifestyles and behaviours

Delivering our low carbon future will rely on the everyday actions of people. An understanding of energy efficiency and the interactions between lifestyle and the environment that will become routine for most businesses, organisations and households. Smart meters in a smart city will be used by smart citizens; neighbourhoods will be active in social participation, increasingly providing their own goods and services, engaged in innovation, enterprise and creativity as well low carbon living.

The culture shift is critical because up to 20% of the energy we use is down to the way we use our buildings and our chosen modes of transport rather than the technologies we have in place. Creating the space in which residents and businesses can easily make the choice to use buildings and transport in a more energy efficient way, enables them to create a ‘triple dividend’ – saving resources, tackling climate change and fuelling demand in the local low carbon economy. Similar choices about sustainably-produced local goods and services recycles wealth locally and reduces our ‘outsourcing’ of carbon emissions to other parts of the world.

Building upon our culture of strong partnerships, both locally and across Greater Manchester, we need to provide training and learning opportunities, change the way we plan and think about services, so that low carbon practice becomes the norm in how we live, work and play. We will need to create more common and consistent communications so that messaging and behaviour at school, at home and in the workplace makes the positive connections between individual choices, future prosperity for all and equity between generations and places.

At the same time, our strategy aims to grow our international reputation as a green city for visitors and investors, to export our knowledge, expertise and products, stimulating a virtuous circle of commitment to sustainability, prosperity and a high quality environment where procuring low carbon choices is easy, and value for the environment is visibly present in the spaces of neighbourhoods, workplaces and the urban centre.

We will track our progress on this objective through two indicators:

the number of businesses and organisations voluntarily reporting emissions changes in consumer preference towards low carbon goods and services
PART 2: ACTIONS TO 2020

The four objectives of our strategy establish the priority outcomes we aim to achieve: a strong low carbon economy, substantially reduced emissions, resilience to the risks and opportunities of a changed climate and a culture in which environmentally smart behaviour is the norm. Applying these objectives to programmes of activity involves recognising interdependencies that vary with different themes of work.

We know that most of our direct emissions arise from our buildings, from energy generation and from transport: these are three themes of work that also provide key building blocks in the low carbon economy. The capacity of our environment to support delivery of our objectives, expressed as 'ecosystem services', is rooted in another theme, our green spaces and waterways (also known as green and blue infrastructure) and our capacity to drive these changes as citizens and consumers is recognised in a fifth theme – sustainable consumption.

By undertaking and co-ordinating programmes of activity across these five key themes – buildings, energy, transport, green spaces and sustainable consumption – and through a series of enabling and cross-cutting activities, we can develop and manage the co-ordination and interdependency necessary to achieve successful outcomes against all four of our objectives.

7. Actions by theme

7.1 Our buildings

Figure 3 - Age of Housing Stock in Greater Manchester – 80% of our current building stock will still be in use in 2050, underlining the strong need for a retrofit programme.
There are 2.6m people living and working in buildings across the Greater Manchester conurbation with 1.14 million homes. Those homes generate 36% of our direct carbon emissions and the commercial sector generates a further 36%, much of it associated with building use. Most of our building stock is pre-1970 and highly energy inefficient: with 4 out of 5 buildings likely to still be in use in 2050, retrofitting programmes need to play a very substantial part in meeting our 80% carbon target.

The challenge of retrofitting all our building stock to such very high standards is immense, but, over a 40 year period, the efficiencies are immense too. Taking the economic opportunity to be a leader in this fast-growing field of ‘green retrofitting construction’ has already begun with the delivery plan for Greater Manchester as a Low Carbon Economic Area for the Built Environment (LCEA). Significant momentum has been achieved through a partnership that is actively developing the opportunities provided by co-ordinating plans and resources through the forthcoming Green Deal. Improving the energy performance of our buildings will have substantial social and economic impact, increasing the effectiveness of businesses and public services and the quality of life for all residents, particularly those on low incomes or in fuel poverty.

Investing in programmes that achieve a step change in the energy efficiency of our existing stock – domestic, commercial and public – lies at the heart of our strategy: it improves environmental sustainability, improves energy efficiency and security and it can be an engine for jobs and business development. At the same time new build will continue and we need to deliver against nationally-set standards for new buildings: zero carbon standards need to be in place for homes by 2016 and commercial properties by 2019.

We also need to change the way we use buildings to maximise their capacity for efficiency and ensure that our retrofitting programmes are ‘future-proofed’ and adapted to a changing climate.

Our building programmes will include the adoption of micro-generation, smart metering and conservation technologies. They will be developed in parallel with infrastructure projects such as district heating and cooling, digital infrastructure, smart grids and green space – and with cultural schemes that actively engage residents in improving energy efficiency in their homes.

**Key outcomes by 2020 will be:**

- Carbon emissions from our buildings reduced by 6%; standards for new and existing buildings in place; a rolling programme of co-ordinated, proactive and responsive retrofitting projects for domestic, public and commercial properties completed under the Green Deal and Greater Manchester established as a centre of the building retrofitting industry.

- Climate change adaptation measures will be embedded in our retrofitting programmes and a key design feature in all our

---

6 To be agreed following outcome of metrics work
regeneration programmes for streets, public buildings and open spaces, establishing increased capacity to accommodate the increased need for summer cooling and higher risk of both drought and flooding, as well as a greater sense of place.

- Partnerships will be in place to create scale and demand in low carbon buildings; investment programmes, well-developed local businesses, skills and training programmes will have generated local employment and growth in Greater Manchester’s supply chain. The creation of these partnerships will be done in such a way as to ensure that markets and opportunities are opened up rather than confined and restricted.

- Carbon literacy will be commonplace amongst residents, and employees with widespread understanding about how energy in buildings works.

To achieve these outcomes we will:

- Deliver the workstreams in the LCEA Delivery Plan, creating a low carbon investment framework and ensuring that training and supply chain support are integrated into the development of retrofitting initiatives.

- Deliver a Greater Manchester approach to retrofitting strategy and standards that includes energy efficiency, climate change adaptation and behaviour change and a common approach to maximising energy efficiency benefits from planning and building regulation.

- Create a strong partnership to develop and drive a co-ordinated programme of Greater Manchester Green Deal schemes that provides for both pro-active and responsive approaches, maximises the opportunities to engage all property owners and all types of building stock, and reduces fuel poverty by providing affordable warmth to vulnerable groups.

- Enable the Green Deal Social Housing Trailblazer projects to 2013, utilising the scale of the social sector to building on existing partnerships and investors to test and pioneer retrofitting programmes.

- Enable communications, messaging and ‘carbon literacy’ training on buildings and energy to provide common messages and a locally-flexible branded approach.

- Influence developers to deliver standards for new build and refurbishment of commercial premises, including accelerating the adoption of zero-carbon standards and tackling multi-occupancy building.
- Influence research, technological development, best practice, skills demand and enable business-to-business opportunities to inform the development of Greater Manchester Green Deal schemes

- Influence Government to maximise the take up of new low carbon business support initiatives to improve the efficiency of our commercial buildings, including access to the Feed-In Tariff, Green Deal, Renewable Heat Incentive, and the Green Investment Bank.

**Targets for work on this theme will include: -**

Reducing emissions from our homes, public and commercial buildings; substantially growing low carbon construction businesses and suppliers; integrating mitigation and adaptation measures in retrofit programmes, as well as new build, increasing awareness and cultural change.

Greater Manchester has over 240,000 homes (22% of total stock) that will required comprehensive whole house retrofit treatment in order to meet government requirements for energy efficiency and reduced carbon emissions. To achieve the levels of activity required, capital expenditure well in excess of £8 billion will be required over the next 20-30 years.
7.2 Energy distribution and generation

Greater Manchester is powered by a mix of gas, electricity, transport fuels and a small amount of oil, solid fuel and biomass. Only a small percentage of its energy comes from renewable energy sources. Energy security and a low carbon economy mean that we need to significantly reduce our dependency on fossil fuels such as gas, coal and petrol, whether used directly for heating and transport, or indirectly to generate electricity.

Carbon reduction strategies to reduce energy demand in homes and buildings, and reduce emissions from transport are likely to shift the UK's energy mix from gas and transport fuel to electricity. This means that while overall fossil fuel use will decrease, electricity use is likely to increase over the next twenty years. Alongside this, the cost of electricity is also expected to increase due to both fossil fuel prices and the costs of investing in generation, distribution and management infrastructure.

Nearly all of the electricity consumed in Greater Manchester is generated nationally and distributed through national infrastructure in a regulated, partitioned and highly complex market. Decarbonisation of the grid through development of less carbon intensive fossil fuel power stations (carbon capture; gas turbines), large scale renewable energy programmes (e.g. from on and offshore wind farms, water related power, biomass) and nuclear power will significantly reduce emissions generated from our use of electricity.
Opportunities exist for large energy projects such as these to be sited within Greater Manchester, but they are relatively limited, and the policy levers available to local government to shape the energy system are also limited.

This means that opportunities for Greater Manchester centre on creating the right market conditions to deliver on energy opportunities, procuring energy from low carbon sources, and taking steps to reduce and manage our energy demand.

We need to create the right market conditions via influencing, partnerships, economic and planning policies to ensure that the electricity used in Greater Manchester comes from low carbon sources, minimise electricity use in homes and organisations, deliver local low carbon energy generation schemes, manage energy consumption to reduce both grid demand and fossil fuel derived generation, and secure a substantial share of the market opportunities that such a significant transition will bring.

Reducing energy demand, and adapting to a new energy supply environment are vital to achieving Greater Manchester’s energy goals and GM is well positioned to show leadership on this via its work on retrofit, and managing energy demand. As the country adopts a low carbon energy system, there will be a much greater requirement for demand-side response to balance the energy network. This demand side response includes altering our patterns of energy demand and consumption to make best use of times when low carbon energy generation capacity is available, which, when carbon pricing is taken into account, will also be the cheapest times to consume energy. In the longer term, development of local energy storage could enhance the benefits of active energy demand management. This will deliver economic benefits and reduce the carbon impact of energy use.

While we have some influence over large scale generation of electricity in our own area, the majority of large scale schemes will take place outside Greater Manchester – the Committee on Climate Change suggests 30-45% of energy will come from renewable sources by 2030, and this is reflected in the Government’s 4th Carbon Budget. While it is a priority to continue to recognise and influence national government’s critical contribution to this strategy, local contributions to generation, – heating and cooling networks and smart grids, through how we procure energy, and how we support our energy businesses are essential for Government to meet its targets.

These local contributions to generation and infrastructure form part of a process of decentralisation of energy networks, enabling authorities, organisations and households to participate in local networks and to generate power and heat for themselves or for distribution. If energy generation and heat network opportunities already identified are delivered, they could deliver a reduction of up to 5% in Greater Manchester’s annual CO2 emissions by 2020. While not significant when set against an overall target in excess of 30%, these steps are essential to create the wider supply chain opportunities and market conditions for Greater Manchester to deliver a low carbon economy.
We will put in place a Greater Manchester Energy Plan which promotes a consistent understanding of energy issues, provides a coherent performance framework and establishes a clear pathway to achieving the following:

Key outcomes by 2020 will be:-

- For users to understand that the cost and carbon impact of their energy use is linked to their patterns of consumption, and have access to support systems and schemes to help both reduce demand, and balance capacity, demand, carbon and cost – GM has the opportunity to demonstrate national leadership in this area.

- To have created market conditions which promote low and zero carbon energy generation and distribution opportunities across Greater Manchester, including local renewable power stations, leading and facilitating the development of local heating, cooling and smart grid networks and integrating microgeneration opportunities into our new building development standards and retrofitting programmes.

- To have strengthened our understanding and ensured that existing and planned energy infrastructure is secure, resilient to the impacts of climate change, changes in energy use and the connection of local low carbon supplies, and to have integrated energy security issues into our planning for civil contingencies.

- To have developed community understanding of the urgent need to decarbonise the energy supply to minimise climate change and also the need to ensure an affordable secure supply for the future – this will involve wider discussion about the infrastructure implications at a neighbourhood level.

- Continued support and investment in UK renewable and low carbon energy generation via our energy procurement strategies,

- To have created market opportunities for the greater than £100 million of energy research being undertaken by Greater Manchester’s universities, and work to increase the size, economic and jobs contributions of Greater Manchester’s energy sector.

- To have integrated the development of new heating and cooling networks and the development of locally generated power networks with the development of major retrofitting programmes and role out of smart technologies so that networks can expand as heat demand from retrofitted property decreases.

- To be early adopters of smartgrids, smart technologies and energy storage, improving the efficiency of our energy system.

To achieve these outcomes we will:
Deliver a co-ordinated approach to actively supporting the development and delivery of energy projects, focusing initially on a discrete number of exemplar schemes across generation, distribution, smartgrids, pricing, charging and storage that demonstrate technologies and investment models for further development.

Deliver a low carbon investment framework that provides and recycles access to cost effective capital for low carbon projects.

Deliver a spatial strategy and policy instruments which optimise collaboration between District Core Strategies, the National Planning Framework and local opportunities, and create a robust, transparent and supportive framework which engages communities in balancing the need to encourage large and small scale generation and secure locations for energy infrastructure with local interests and amenity concerns.

Deliver a co-ordinated communications programme, promoting energy training and ‘carbon literacy’, making energy use and carbon emissions publicly ‘visible’, including a rapid roll out of smart meter and energy information technologies to encourage informed use of energy.

Enable the right market conditions to be developed to promote investment and action in Greater Manchester via establishing governance and partnership arrangements which promote strong working relationships with key energy organisations.

Influence the development of energy programmes to ensure that training and supply chain support are integrated into their development.

Influence existing and new energy generation and distribution companies to ensure they have effective strategies for resilience, adaptation and the upgrading of networks, and the connection of low carbon technologies.

Influence government policies and funding streams by working in partnership with them to ensure they are aligned with GM’s energy opportunities and challenges.

**Targets for work on this theme will include:**

Reducing emissions through the development of heating and cooling networks and generation from renewables; building the market for energy infrastructure; assessing and acting upon energy security and supply risks related to climate change adaptation; and stimulating culture change through the development of systems and tools to actively manage energy use, including smart grids, smart metering and contract innovations.
7.3 Transport

Greater Manchester is connected through a large diverse and dynamic series of transport hubs and connections; from the extensive motorway network to the Metrolink system connecting many of the region’s towns. Transport, including rail, accounts for over 30% of our total emissions and future growth projections indicate that is likely to increase if no action is taken. By pursuing a range of complementary policies on fuel and vehicle efficiency and through the application of lower carbon fuels and changes in modal shift - to active travel for short trips or to public transport for longer journeys - we will be able to reduce emissions and retain a high level of mobility for people, goods and services.

The development of infrastructure and technology needs to be accompanied by changes in culture that create more flexible practice, behaviours and travel habits; this will need to be supported by improved pedestrian and cycle infrastructure, driver and cycle training and support for the uptake of low carbon vehicles and fuels. These ‘Smarter Choices’, will be further enabled by the substantial ongoing expansion of the Metrolink tram network, removing 5 million car journeys per year and increasing the number of daily passenger trips from 55,000 to 90,000.

The 3rd Greater Manchester Local Transport Plan (LTP3) was published in March 2011, setting out the spending review period (2011-2015) and longer term for transport strategy (15-20 years).

Key outcomes by 2020 will be:-

Figure 5 - Interconnectivity of major existing and planned Greater Manchester Transport Networks and Nodes
To have set targets for the reduction of carbon emissions from transport, establishing an attainable 2020 milestone and developing detailed emission reduction outcomes from modal shift, fuel efficiencies and infrastructure development.

To have developed the implementation plans for LTP3 and the application of Government support (e.g. from Local Sustainable Transport Funds) so that climate change outcomes are delivered as part of the economic objectives and the transport infrastructure develops resilience to prepare for an increase in extreme weather events.

Through design and maintenance of the transport network and provision of services, to have stimulated active travel and modal shift, supporting sustainable neighbourhoods and public space and providing equality of transport opportunities, developing low carbon transport that supports our economy and improves the quality of life and the success of business.

To have reduced the need for travel, by encouraging online services and flexible working practices and reducing the carbon intensity of journeys through promoting electric vehicles, car-sharing, car clubs and cycling.

**To achieve these outcomes we will:**

- Deliver continued development of the Metrolink tram network expansion, increasing daily passenger trips from 55,000 to 90,000 and removing 5m car journeys per year.
- Deliver interchanges including those at Altrincham and Bolton Interchanges and Leigh-Salford-Manchester Busway to stimulate behavioural change through modal shift.
- Develop co-ordinated communications on modal shift, develop image and customer service to encourage large scale behavioural change, providing a common branded approach across Greater Manchester.
- Deliver a smart ticketing system throughout GM to increase awareness and patronage of public transport.
- Enable establishment of GM as a centre for the use of electric vehicles, car clubs and car sharing by supporting an expanding network of charging points, and developing promotions that reduce congestion.
- Enable new approaches and develop strategies to reduce emissions relating to freight.
- Ensure that all new transport infrastructure projects have taken fully into account the risks associated with future climate change.
Targets for work on this theme will include:

- reducing emissions from transport by increasing use of public transport, walking, cycling and electric vehicles; development of economic activity in electric vehicles and public transport; assessing and acting upon transport continuity risks related to climate change adaptation; and stimulating culture change through vehicle and cycle training, active travel planning and modal shift.

### 7.4 Green spaces and waterways

![Green Assets Map](image)

**Figure 6 - Major components of Green and Blue Infrastructure of Greater Manchester**

Our green spaces and waterways (Green and Blue infrastructure) run through Greater Manchester forming a complex network of public spaces, habitats, landscapes, rivers and greenways. This infrastructure provides a critical role in contributing to health and wellbeing, helping us to achieve our carbon reduction targets and protecting our urban environment from the impacts of a rapidly changing climate.

Our commitment to growth and our vision of a vibrant, modern economy, with communities enjoying a high quality of life depends upon a healthy, accessible natural environment. The social and economic benefits that high environmental quality brings are well-documented; in a low carbon economy, benefits grow as the multi-functional benefits of these assets increase their value. Realising our aims of sustainable growth and prosperity for all demands a place for green and blue infrastructure in our strategy.
Maintaining as well as creating and improving green and blue assets is vital to the continued economic success of Greater Manchester but presents a significant challenge in the context of development pressure to accommodate an increasing population and the associated higher capacity requirements on existing infrastructure. Green and blue infrastructure needs to be considered as an integral part of cross-boundary infrastructure and spatial planning frameworks, not least through a proposed AGMA Green Infrastructure Framework and the University of Manchester’s EcoCities programme.

**Key outcomes by 2020 will be:-**

- Carbon sinks will be protected, managed and enhanced as part of our carbon management strategy; carbon sinks include the extensive peat and mossland areas of GM which are also important biodiversity assets.

- A well co-ordinated green and blue infrastructure network that delivers cooling, shelter, resilience and flood management, increasing urban tree cover, local biomass production and food production within strategies that protect biodiversity and provide for local habitat adaptation.

- Integration of green infrastructure into the strategies and work programmes of all organisations working in the growth, sustainability and wellbeing sectors including dissemination of research into costs, levies, standards and benefits.

- Cultural value attached to our green and blue infrastructure will be increased and the benefits (including health and well being for communities), and use of such infrastructure will be maximised through promoting environmental understanding appreciation of our natural landscape heritage.

- To have developed the business case around the positive benefits of risk management and mitigation (including sustainable urban drainage (SUDS), building resilience and urban greening), including the promotion of economic returns and added values of investment in adaptation and mitigation within our urban environment.

**To achieve these outcomes we will:**

- Deliver management of our green infrastructure in recognition of the value and vulnerability of species in adapting to a changing climate.

- Deliver management to develop and extend the scope, capacity and use of our green infrastructure to maximise a full range of ‘ecosystem
services’ – food, fuel, shelter, recreation, resilience – across Greater Manchester and with neighbours across the North West and beyond.

- Deliver work to identify, protect and enhance green and blue infrastructure to increase the carbon sink, reduce emissions and generate energy.

- Enable supply and demand for energy to be matched more effectively including biomass and hydroelectricity; the GM Energy Plan will provide a basis for further work on energy potential from green infrastructure and hydro related energies.

- Enable an improved sub-regional approach to flood risk management and mitigation through coordinated management strategies (including River Basin Management Plans) and development of the GM evidence base (including PFRAs and the GM SWMP).

- Influence, promote and identify sub-regional investment opportunities in green infrastructure, shaping the natural environment to enhance its ecosystems and fulfil growth support functions and multi-functional use of land.

- Influence and maintain partnerships with the Environment Agency, United Utilities and other key stakeholders to manage flood risk as part of the new role for local authorities as Lead Local Flood Authorities.

**Targets for work on this theme will include:**

- reducing emissions by developing the local cooling, fuel supply and food production capacity of our greenspace assets; development of economic activity through realising the financial benefits of greenspace; increasing the capacity of green and blue infrastructure to increase resilience in urban centres and neighbourhoods.
7.5 Sustainable Consumption

The diagram above illustrates the complexity of emissions of Greenhouse gases. The range of emissions sources is extensive – from energy use within Local Authority buildings to the wider ‘scope 3’ indirect emissions associated with the consumption patterns of GM residents. Direct emissions may occur from businesses within the geographical area, but those goods may be consumed outside the boundaries of GM. Likewise, many of the goods and services consumed within GM will result in emissions outside GM, for example, in London or Beijing.

The future need to take ‘embedded’ as well as direct carbon emissions into account will demand that a ‘consumption-based’ approach to emissions reduction is adopted. Everything that we consume through our daily lives has a carbon impact; the goods and services we purchase, the food we eat, the way we use buildings and the way we choose to travel. All result in emissions in production, transportation or use: ‘embedded’ emissions that represent the total amount of energy use in the supply chain.

This approach will transform the traditional view of carbon emissions as they are reallocated to the point of consumption rather than the point of manufacture, and citizens – or customers – will have to take responsibility for their own emissions through the purchasing choices they make. This, in turn, creates the opportunity to change patterns of consumption in Greater Manchester so that the total consumption of our city can be measured in proportion to the ability of natural resources to support it, creating a true ‘whole city’ total carbon footprint.

While much needs to be done at national and international level, we can take action at a city level in some areas of consumption and at particular points in the cycle. We can advance the development of our local low carbon economy...
by promoting choice for consumers, supporting the mapping resource flows and improving systems for the procurement, processing and disposal of resources. The food supply chain and waste reduction and recycling programmes are two priority areas where action by residents and businesses can accelerate progress towards a more resource efficient, low carbon society.

**Key outcomes by 2020 will be:**

- To have developed our understanding of embedded carbon and incorporate a total carbon footprint option into our metrics methodology so that the leadership of pioneering businesses and organisations can be shared and replicated.

- To further develop our understanding of resource efficiency in business and consumption and the ways in which sustainable procurement can drive the development of the low carbon economy.

**To achieve these outcomes we will:**

- Deliver a programme of stakeholder engagement with key audiences, promoting shared understanding of the scale and source of direct and embedded carbon emissions, the concept of the total carbon footprint of Greater Manchester, and discussion of scenarios for its reduction.

- Continue to deliver and extend our Business Pledge and ENWORKs programmes to identify, engage and nurture the next generation of 'low carbon' business leaders and social entrepreneurs as champions of a 'consumption-led' programme in every business sector.

- Continue the delivery of a holistic approach to long-term waste and resource management, increasing recycling rates, reducing waste going to landfill and working with manufacturers, suppliers, retailers, recyclers and waste management companies to refine the efficiencies in the flows of resources and waste.

- Enable the harnessing of potential of the creative industries across Greater Manchester to develop innovative approaches to increase the local manufacture, assembly and repair of low carbon products, and making services and lifestyle choices more visible, engaging different segments of society, and generate large scale cultural change.

- Enable development of capacity of our partnerships between businesses, organisations and social enterprises to develop and mainstream sustainable procurement, supporting suppliers in developing low carbon systems and practices, and increasing the market for ‘low carbon’ goods and services.

- Through developing our understanding of the carbon impacts of food production and processing, we will enable and promote the basis for a
sustainable framework of local food production that connects local producers and consumers, both within GM and across the North West.

Targets for work on this theme will include:

- reducing emissions by developing waste reduction and ‘closed loop’ recycling strategies; growth in the supply and demand for low carbon goods and services; increase in the provision of local goods and services with resultant benefits for lower risks of food and energy security; growth in consumer awareness and understanding of the scope for choice in selecting services with local and environmental benefits.
8. Enabling and Cross-Cutting Actions

8.1 Working across different spatial levels

The environment we share does not recognise political and administrative boundaries at any scale – both within Greater Manchester and beyond. The success of our strategy depends upon collaboration at every spatial scale and is rooted in linking together the mutual benefits for individuals, organisations, communities, cities and nations. The more efficient home, the low carbon business, the sustainable neighbourhood, the ‘decarbonised’ energy infrastructure are all ends in themselves; yet they all contribute to one another and multiply the opportunities for a more prosperous future.

Key outcomes by 2020 will be:-

- To have will developed this strategy as a means for co-ordinating the interdependence between activity at different spatial levels, encouraging and supporting Districts, business organisations, neighbourhoods and households in identifying the actions they can take that contribute to and complement actions at a Greater Manchester scale.

- To have aligned our strategy with national and international climate change targets and will work with national government to encourage them to continue to develop their actions in line with our strategy.

To achieve these outcomes we will:

- Enable opportunities for residents and households to participate in the low carbon economy, planning, and contribute to this strategy.

- Influence all key organisations and the Districts to align our climate change strategies.

- Deliver mechanisms that enable alignment with the climate change plans of businesses and third sector organisations.

- Influence government to maintain its commitments to decarbonising the grid and stimulating the low carbon resilient economy, fulfilling the key national contribution to our strategy.

8.2 Developing a common measurement methodology

Many organisations across Greater Manchester, including our Districts, are actively involved in measuring emissions, using a variety of tools and methodologies. To improve coordination and provide transparency and efficiency, we will seek to develop a robust common approach to carbon accounting and reporting, with standard baselines and timescales.

We will retain the common approach for the Districts developed by National Indicators 185 and 186, and incorporate a continuing close liaison with
Government on methodology compatibility and access to nationally compiled data. We will also optimise compatibility with mechanisms such as the Carbon Reduction Commitment and Carbon Disclosure Project and create opportunities for businesses, communities and individuals to contribute.

This converged approach to carbon accounting will be one of the key outputs of our carbon metrics project. In developing an overall target for Greater Manchester (GM) and a common approach, it will recognise that targets within GM will vary from district to district: each GM district has different opportunities for carbon reduction, as a direct result of differing economic and built landscapes.

This common approach will enable us to track our progress and develop a Greater Manchester pathway to delivering our share of emissions reduction through to 2050 based upon our priorities for economic growth and decarbonisation. This will shape the contribution that each sector needs to make, whether housing, transport, or businesses and inform the development of projects and programmes through carbon accounting and appraisal.

**Key outcomes by 2020 will be:-**

- To have adopted a common methodology for measuring and reporting on carbon emissions to achieve a consistent and convergent approach to performance monitoring across Greater Manchester.

- To have developed prominent reporting on emissions and progress so that businesses, residents and visitors can have easy access to information about our action on climate change.

- To have devised our preferred pathway to emission reduction by 2020 and 2050 that reflects our development priorities, and put in place voluntary carbon budgets and targets.

**To achieve these outcomes we will:**

- Deliver a process of carbon accounting and appraisal to assess the carbon impact of policies and programmes to inform investment decisions, procurement and commissioning by both the public and private sector.

- Deliver annual carbon data reports and disseminate publicly to stakeholders to influence policy and culture.

- Enable agreement and adoption of a common framework of climate change methodologies and tools and a short timescale for convergence.

- Anticipate future developments in carbon reporting, including consideration of outsourced carbon, deferred carbon costs, and
lifecycle analysis, and seek to build this into our monitoring approach at the earliest opportunity.

8.3 Co-ordinating business and organisation networks

Several ‘business environment’ networks have developed in Greater Manchester over the last ten years, often part of national or regional initiatives, often meeting the needs of particular business sectors providing support on resource efficiency linked to risk, reward and reputation. More than 3000 organisations participate in these networks, making significant contributions to the economy, to a collective increase in knowledge and practice of resource efficiency and environmental responsibility and to an increase in local demand for low carbon goods and services.

There is now an opportunity to build from this platform to further embed resource efficiency into Greater Manchester businesses, support those companies who have, or could develop new, low carbon environmental goods and services and broaden the base of local supply chains in the low carbon economy. This will enable businesses to benefit from early adopter advantage and drive future prosperity. Early action at a Greater Manchester will also help bridge any gaps that arise in support and advice as national programmes such as WRAP or the Carbon Trust see their funding being cut.

Key outcomes by 2020 will be:-

- To have developed a co-ordinated approach to business support networks to enable business to realise their full potential in, and towards a low carbon economy, providing companies with access to knowledge, expertise and practical skills to enable them to adapt, and reduce their exposure to, climate change risks and facilitate the relative decoupling of growth from carbon emissions through increased resource efficiency.

- For these networks to help stimulate and support companies to develop low carbon environmental goods and services, supporting social, economic and environmental development in a carbon constrained world.

To achieve these outcomes we will:

- Enable extended and aligned networks of green business support and development to meet the needs of all types of business organisations.

- Align these networks to stimulate the market for low carbon environmental goods and services.

- Enable companies to understand the carbon in their supply chains and take action to manage and mitigate this.

- Enable green ‘business-to-business’ activity to accelerate demand.
- Maximise the opportunity for business engagement in carbon measurement, reporting and promotion across GM.

- Influence and support new low carbon / low resource social enterprise

- Identify and support green collar enterprise as well as collaborative sustainable consumption and production opportunities across Greater Manchester.

8.4 Recognising health and wellbeing

The impacts of climate change will impact upon everyone in Greater Manchester, but it will be most keenly felt by the most vulnerable members of society who have least choice and are less able to adapt. We need to address the risk that people and places facing poverty and disadvantage are likely to be disproportionately affected by climate change, and our plans need to ensure that we maximise their access to low carbon solutions. We will embed our understanding of the potential impacts of climate change on human health into Greater Manchester’s wellbeing strategies, facilitate access to low carbon goods and services by the most deprived, adapt our service provision, and create an accessible quality environment for all.

**Key outcomes by 2020 will be:-**

- To have minimised the risks and impacts of climate change on health and well-being and prioritise the needs of those in the most deprived neighbourhoods.

- The integration of low carbon projects into neighbourhood plans, promoting carbon literacy, stimulating engagement and providing support for local action that increases active participation and sustainable social enterprise.

**To achieve these outcomes we will:**

- Deliver retrofit programmes that target vulnerable neighbourhoods and recognise that with fuel poverty, the first priority may be health, not carbon.

- Enable shared knowledge of potential impacts by mapping the spatial perspective of vulnerability, environmental quality and access to environmental goods and services.

- Enable the resilience of Health/Fire/Police and Civil Contingency services and develop extreme event scenarios.

- Influence low carbon economic activity, interaction and interdependency at neighbourhood level, giving priority to the most deprived communities.
• Promote and facilitate the environmental and health benefits of active and sustainable travel.

8.5 Building skills, securing investment

Developing a whole ‘prospectus’ for Greater Manchester as a low carbon city will require substantial investment and new technical skills as well as new knowledge and understanding. This will impact on, and require action at all levels from, individual employees and households through to SMEs and multinationals requiring both capacity and a diverse skills set.

A single assessment framework for investment in Greater Manchester will incorporate a sustainability appraisal that assesses climate change risk and opportunity for all major schemes and we will grow this approach in line with the market to ensure that sustainability comes to the fore of investment considerations across GM, facilitating our transition to a low carbon economy.

Key outcomes by 2020 will be:

• To have incorporated our vision of Greater Manchester’s future as a sustainable low carbon city into our strategies for investment and skills development, addressing the opportunities and challenges presented by climate change through enterprise and innovation.

• To have strengthened and supported the supply chain to reduce exposure to environmental risk and to stimulate the provision of low carbon goods and service.

To achieve these outcomes we will:

• Deliver exemplar projects and a replication process that brings low carbon projects to market.

• Deliver an approach that maximises the opportunities from implementing carbon accounting for all investments.

• Enable provision of business support on Environmental Risk, Reward and Reputation.

• Enable the workforce required for retrofitting programmes, energy efficiency and infrastructure development.

• Influence the work of FE, Universities and businesses on low carbon skills, green apprenticeships.

• Enable investment planning, enterprise development, training and supply chain development in the GM Green Deal programmes.
Influence energy efficient procurement activity and social enterprise as a key component of animating local neighbourhoods.

8.6 Embedding action on climate change within the spatial strategy

The development of our Spatial Framework will reorganise the connections and interdependencies between different geographical areas and environmental and economic capacities for change, including our interactions with the climate. The framework will prioritise flows of people, energy, water and resources to reduce our future ‘footprint’ and maximise future security, recognising the interdependencies of economic centres and neighbourhoods and the infrastructures that connect them to each other and the wider environment. It will ‘add value’ to Local Plans produced by individual districts and help to plan and manage our shared opportunities, risks and consequences.

Our framework will approach Greater Manchester as a single functional economic market area, managing the interactions between local distinctiveness and the broader functioning of the city, looking beyond the lifetime of a plan, and incorporating understanding of the relevant long term climate risks and consequences facing both the districts and Greater Manchester as a whole.

Key outcomes by 2020 will be:-

- To have developed and applied our knowledge of climate change challenges and opportunities in the cross boundary frameworks for spatial and infrastructure planning within Greater Manchester and our neighbours.

- To have developed these frameworks to identify the synergies and opportunities, resolutions and solutions between the challenges of climate change and our pursuit of economic growth, investment in strategic infrastructure and our traditions of culture and place.

- To have shaped Greater Manchester as a place that secures radical cuts in emissions, secures growth whilst minimising vulnerability and increasing resilience.

To achieve these outcomes we will:

- Deliver work to Identify, protect and provide areas of high biodiversity and 'carbon sinks', maximising opportunities to enhance and protect the natural environment in the long term.

- Enable convergence on key development requirements such as low carbon energy and prioritise energy planning at the sub regional, district and neighbourhood level.
- Enable Strengthened adaptation functions that operate on a sub-regional/regional scale e.g. water supply, flood risk management, transport and green infrastructure.

- Enable co-ordination of climate change and sustainability requirements in Core Strategies and Development Plan Documents across GM to create and maintain a GM standard.
9. Governance and Delivery

Our strategy sets a single framework of priorities for action across Greater Manchester, and our approach will be to further develop joint-working arrangements so we address these opportunities as a co-ordinated team.

We will build upon our extensive track record of partnership working. Groups of organisations are already working together in several areas including Green Deal development and joint plans for energy, green infrastructure, spatial frameworks, electric vehicles and flood risk management. The Environment Commission is in place to oversee this agenda, action on some themes – transport and waste – are already managed collectively through TfGM and GMWDA, and GM is served and supported in other areas by the Manchester Family of organisations.

While the governance overview of the whole strategy will be undertaken by AGMA’s Environment Commission, we will extend management and implementation functions at a Greater Manchester scale, creating a strong single mechanism for Districts and partners from all sectors to work as a co-ordinated team. This team will be developed to work alongside all the other units of AGMA, GMCA, the LEP Board and the Manchester Family to provide one source of co-ordinated climate change advice, information, policy and communications.

By converging systems and resources, we will make the most of efficiencies, reduce duplication and focus capacity on shared priorities. With one set of climate change plans and metrics, co-ordinated environmental communications and common programmes for investment and appraisal, we will ensure that the objectives of our strategy are translated across all of Greater Manchester’s strategic priorities. Presenting these as a rolling programme of annual plans and milestones will be initiated by this strategy: a draft plan to 2014 is appended here as Appendix A.

The co-ordinating role of the Environment Commission will involve closer joint working with AGMA’s other Commissions, GMCA and the LEP. It will also entail a headline monitoring progress through the performance indicators, providing reports on the collective impact of our plans and programmes and overseeing the collection and collation of indicative carbon data across Greater Manchester.

Implementation will depend upon the development of investment programmes and the progressive adoption of these priorities by a large number of organisations operating at different scales and often working collaboratively. Each District, organisation, and neighbourhood will continue to make, develop and deliver its own plans and programmes, but they will form parts of a co-ordinated whole, supported, guided and informed by a team that ensures we share knowledge and good practice effectively and convert ideas into scaleable projects that can benefit all parts of our city.

Some key aspects of our strategy depend substantially upon action being taken nationally and internationally, particularly in decarbonising the national
electricity supply and establishing policy, regulation and programmes that incentivise change. We will work closely with national, north-western and core-cities partners to influence and contribute to actions taken by Government and national organisations.

The Environment Commission’s LCEA Programme Board will maintain an overview of low carbon projects in the LCEA workstreams and we will create the capacity to support a common carbon metrics reporting function. We will work with the Greater Manchester LEP, business leaders and the GM Chamber of Commerce to support and monitor enterprise activity in the private sector and promote low carbon efficiencies in business development. Stimulating investment in low carbon projects and optimising sustainability in economic development will be overseen by our GM Investment Centre of Excellence.

Responsibility for progressing key themes of work will include the following:-

- **Buildings**: the Environment and Planning & Housing Commissions will maintain an overview of retrofitting programmes that will be implemented by partnerships including business partners, Districts, housing and property organisations working together through the Green Deal. Districts will oversee the progress of low carbon new buildings.

- **Energy**: The Greater Manchester Energy Group will oversee the implementation of a GM Energy Plan and work with energy companies, Districts and other agencies to deliver changes in generation, distribution and supply.

- **Transport**: Transport for Greater Manchester will lead the work on sustainable travel, co-ordinating work with Districts and partners through LTP3, the Sustainable Transport and its Local Implementation Plans.

- **Green & Blue Infrastructure**: the Planning & Housing Commission will maintain an overview of our Green Infrastructure Plan, working closely with the Environment Agency, Districts and partners on plans and programmes that maximise the capacity of our waterways and greenspaces to improve environmental quality.

- **Sustainable Consumption**: the Environment Commission will progress a policy overview, working with the Improvement & Efficiency Group on co-ordinated sustainable procurement and Greater Manchester Waste Disposal Authority on an overview of our municipal waste and recycling policies and mechanisms.
Conclusion

It would be a fundamental error to see this strategy as some kind of prospectus; a menu of strategic options; a smorgasbord of ‘nice to haves’. The actions etched out upon the preceding pages are essential and in some respects only the start of a much greater revolution in the way we live, work and play.

Climate change is happening now and if we do not craft a new industrial and civic strategy to respond to it with all of the energy and innovation which Greater Manchester is rightly famous for, we will be perilously disadvantaged in the years ahead.

With the same breath, if we fail to fully adapt to inevitable climate changes we risk exposure to extreme climate impacts which will hit our businesses, our infrastructure and in far too many cases, our most disadvantaged communities. It is our collective duty to prepare for a very changed future.

Across the world, great cities and city regions are blazing a trail on climate change often leaving their home nations standing in their wake. We should be fully aware to the fact that there is a global league of ‘climate-friendly’ cities who we should see as our true competition and as our benchmark for success.

More detail will follow on the heels of this strategy and it will of course need revising. When we better know the details of our proposed delivery mechanisms, when carbon financing and accounting becomes clearer, when a national green deal comes into play, there will be a need to return to this strategy and ensure it is still as fresh and on target as it needs to be.

Action on climate change is a fast-moving landscape in policy terms; our collective challenge is to start to match that pace with reductions, not increases, in our global CO2 emissions. We need to match our words with measurable progress, and do so very quickly indeed.
